Exercise 1.

Let $f : \mathbb{R}^n \mapsto \mathbb{R}$ be a function such that $|f(x)| \leq \|x\|^2$ for every $x \in \mathbb{R}^n$. Show that f is Fréchet differentiable in 0.

Solution: By hypothesis, $f(\vec{0}) = 0$

$$\lim_{\|x\| \to 0} \frac{f(x) - f(\vec{0})}{\|x\|} \leq \lim_{\|x\| \to 0} \frac{\|x\|^2}{\|x\|}$$

$$= 0.$$

Thus, the linear function $\ell(x) = 0$ is the Fréchet derivative of f at 0.

Exercise 2.

Let $f : \mathbb{R}^2 \mapsto \mathbb{R}$ given by

$$f(x, y) = \frac{xy^2}{x^2 + y^4}$$

if $(x, y) \neq (0, 0)$, otherwise 0.

a) Show that f has directional derivatives at the origin for every direction d.

b) Show that f is not Gâteaux differentiable at the origin.

c) Show that f is not continuous at the origin.

Solution Part (a)

The directional derivate of f at a direction $d = (x, y)$ at the origin is defined as

$$f'(\vec{0}; d) = \lim_{h \to 0^+} \frac{f(hd) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{h^3 xy^2}{h^3 x^2 + h^5 y^4}$$

$$= \lim_{h \to 0^+} \frac{xy^2}{x^2 + h^2 y^4}$$

$$\overset{\text{(L'Hospital)}}{=} \frac{y^2}{x}$$

Solution Part (b)

$$f'(\vec{0}; e_1) = \lim_{h \to 0^+} \frac{f(he_1) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{h \cdot 0^2}{h^3 + 0^4}$$

$$= 0,$$

$$f'(\vec{0}; e_2) = \lim_{h \to 0^+} \frac{f(he_2) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{0 \cdot h^2}{0^2 + h^5}$$

$$= 0.$$

If we take the direction $d = (1, 1)$.

$$f'(\vec{0}; d) = 1 \neq 0 = f'(\vec{0}; e_1) + f'(\vec{0}; e_2).$$

So f' is not a linear function, and thus, f is not Gateaux differentiable.

Solution Part (c)

In order to prove that the function is not continuous, take the curve

$$x(t) = t^2, \ y(t) = t, \ t \in (0, 1).$$

Then, if the function is continuous, then the following limit should be unique,

$$0 = \lim_{\|(x,y)\| \to 0} f(x,y) = \lim_{t \to 0^+} f(x(t), y(t))$$

$$= \lim_{t \to 0^+} \frac{t^2 \cdot t^2}{t^4 + t^4}$$

$$= \lim_{t \to 0^+} \frac{t^4}{2t^4}$$

$$= \frac{1}{2}.$$

But that would lead to a contradiction.

Exercise 3.

Let $f : \mathbb{R}^2 \mapsto \mathbb{R}^2$ given by

$$f(x,y) = \frac{2y \exp(-x^{-2})}{y^2 + \exp(-2x^{-2})}$$

if $(x,y) \neq (x,y)$ and 0 otherwise. Show that f is Gâteaux differentiable at the origin but it's not continuous.

Solution:

Let $d = (x,y)$ be the direction where we are differentiating. We want to show that $f'(\vec{0}, d)$ exists for any $d = xe_1 + ye_2 \in \mathbb{R}^2$ and it's linear

$$f'(\vec{0}; d) = \lim_{h \to 0^+} \frac{f(\vec{0} + hd) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{2hy \exp(-(hx)^{-2})}{h(h^2 y^2 + \exp(-2(hx)^{-2}))}$$

$$= \lim_{h \to 0^+} \frac{\exp(-(hx)^{-2})}{h^2 y + \exp(-(hx)^{-2})}$$

$$_{\text{(L'Hospital)}} = 0.$$

However, note that the function is not continuous. For instance, take the curve

$$x(t) = \sqrt{\frac{-1}{\ln t}}, \ y(t) = t, \ t \in (0,1)$$

Note that if we assume that f is continuous, then the following limit should be unique

$$0 = \lim_{\|(x,y)\| \to 0} f(x,y) = \lim_{t \to 0^+} f(x(t), y(t))$$

$$= \lim_{t \to 0^+} \frac{2te^{\ln t}}{t^2 + e^{2\ln t}}$$

$$= \lim_{t \to 0^+} \frac{2t^2}{2t^2}$$

$$= 1.$$

But this would lead to a contradiction.

Exercise 4.

Let $f : \mathbb{R}^2 \mapsto \mathbb{R}^2$ given by

$$f(x,y) = \frac{x^3 y}{x^4 + y^2}$$

if $(x,y) \neq (x,y)$ and 0 otherwise. Show that f is Gâteaux differentiable at the origin but it's not Fréchet differentiable.

Solution:

The directional derivative is:

$$f'(\vec{0}; d) = \lim_{h \to 0^+} \frac{f(hd) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{h^4}{h^5 + h^3}$$

$$= \lim_{h \to 0^+} \frac{h}{h^2 + 1} = 0.$$

And the partial derivatives evaluated at the origin,

$$f'(\vec{0}; e_1) = \lim_{h \to 0^+} \frac{f(he_1) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{h^3 \cdot 0}{h^5 + 0^2}$$

$$= 0,$$

$$f'(\vec{0}; e_2) = \lim_{h \to 0^+} \frac{f(he_2) - f(\vec{0})}{h}$$

$$= \lim_{h \to 0^+} \frac{0 \cdot h}{0^4 + h^3}$$

$$= 0.$$

Thus, it follows that f' is linear and the Gâteaux derivative exists. On the other hand, in order to prove that f is not Fréchet differentiable at the origin, assume for the sake of contradiction that it is. Then, we know that since the limit is unique,

$$\lim_{\|v\| \to 0} \frac{f(v) - f(\vec{0}) - \ell(v)}{\|v\|} = 0,$$

where $\ell(v) = f'(\vec{0}; v) = 0$. However, by taking the curve

$$x(t) = t, \quad y(t) = t^2.$$

Then, using the uniform convergence provided by the Fréchet differentiability,

$$0 = \lim_{\|v\| \to 0} \frac{f(v) - f(\vec{0}) - \ell(v)}{\|v\|} = \lim_{t \to 0} \frac{f(x(t), y(t)) - f(\vec{0}) - l(x(t), y(t))}{\|(x(t), y(t))\|}$$

$$= \lim_{t \to 0} \frac{\frac{t^3 t^2}{t^4 + t^4}}{\sqrt{t^2 + t^4}}$$

$$= \lim_{t \to 0} \frac{t^5}{2t^5 \sqrt{1 + t^2}}$$

$$= \frac{1}{2} \lim_{t \to 0} \frac{1}{\sqrt{1 + t^2}}$$

$$= \frac{1}{2}.$$

Therefore, a contradiction.

Exercise 5.

Calculate the first 2 derivatives of the function $f(X) = \det(X)$ for a $n \times n$ symmetric matrix X.

Solution:

We know that for $f : \text{Sym}_{++}^n \mapsto \mathbb{R}$, $f(X) = \ln(\det(X))$, $Df(X) = X^{-1}$. Also, the inner product here is defined as

$$\langle A, B \rangle = \text{tr}(A^* B)$$

Using the chain rule,
$$D(g \circ f) = (Dg \circ f) \circ Df$$

Thus, by defining $h(X) = \det(X) = \exp(\ln(\det(X)))$, we obtain

$$Dh(X) = (D \exp)(\ln \det(X)) \cdot (D \ln \det)(X)$$

$$= \exp(\ln \det(X)) \cdot X^{-1}$$

$$= e^{f(X)} \cdot Df(X).$$

For the second derivative, we know that $Hf = D(Df)(X)(Y) = -X^{-1}YX^{-1}$. Therefore, the Taylor approximation is

$$f(Z) = f(X) + \langle X^{-1}, (Z - X) \rangle - \frac{1}{2} \langle X^{-1}(Z - X)X^{-1}, (Z - X) \rangle + o(\|Z - X\|^2).$$

With this definition, we can use the chain rule on $D(Dh)$.

$$D(Dh)(X)(Y) = D(e^{f(X)} \cdot Df(X))(Y)$$

$$= [Df(X) \cdot e^{f(X)} \cdot Df(X)](Y) + e^{f(X)} \cdot D(Df)(X)(Y)$$

$$= e^{f(X)}(X^{-2}Y - X^{-1}YX^{-1})$$
